Experiment - 12

Demonstrate Virtualization by Installing a Type-2 Hypervisor

Aim

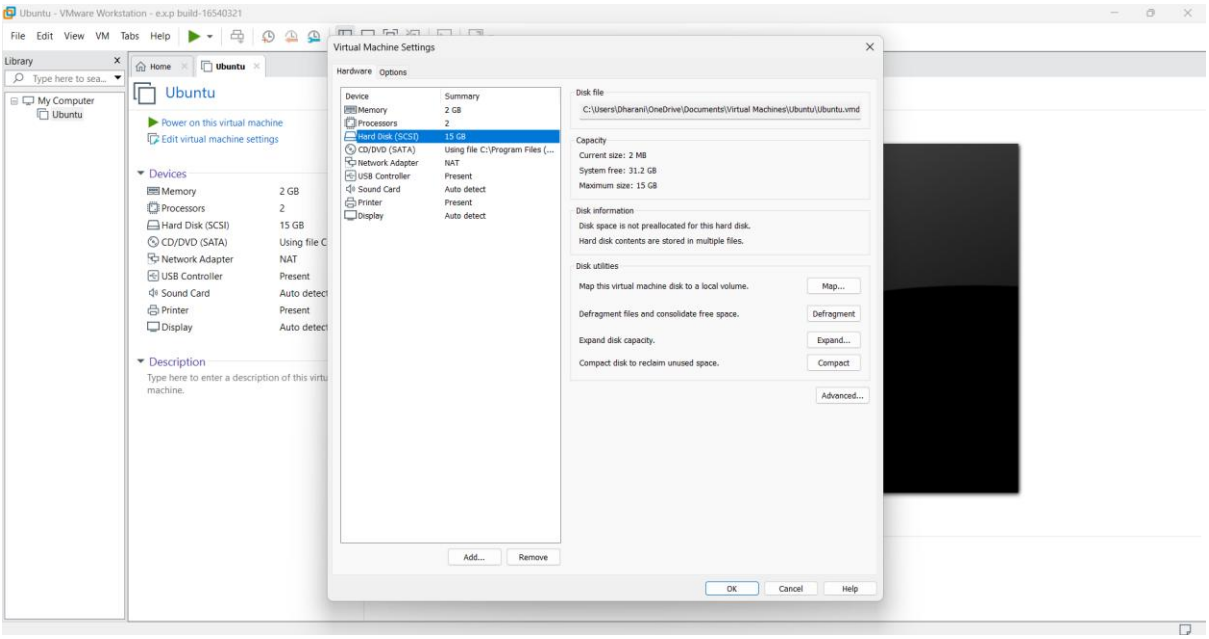

To demonstrate virtualization by installing a Type-2 Hypervisor on a computer, creating and configuring a virtual machine (VM), and installing a host-supported operating system in the virtual machine.

Procedure

1. Start the computer and check the host operating system.
2. Download Oracle VirtualBox from the official website: https://www.virtualbox.org/
3. Run the installer and follow the installation instructions.
4. Open VirtualBox after installation.
5. Download an operating system ISO file, such as Ubuntu, from https://ubuntu.com/download/desktop.
6. Click New in VirtualBox to create a virtual machine.
7. Enter a VM name, such as Ubuntu-VM.
8. Select the downloaded ISO file as the installation media.
9. Allocate suitable RAM and CPU resources to the VM.
10. Create a virtual hard disk and allocate sufficient storage.
11. Review the configuration and finish creating the virtual machine.
12. Start the VM and follow the operating system installation instructions.
13. Restart the VM after installation, if required.
14. Verify that the operating system runs successfully inside the virtual machine.
15. Observe that the guest operating system operates in a virtual environment while the original host operating system remains installed on the computer.

Implementation

Output:

Result

Thus, virtualization was successfully demonstrated by installing a Type-2 Hypervisor, creating a virtual machine, and configuring a guest operating system to run within the host operating system.
