Experiment - 10

C Program to Display Student Information Hosted in the Cloud

Aim

To develop a **C program** to display **student information and execute it in a cloud-based programming environment** to demonstrate the use of cloud computing resources.

Procedure

1. Open a cloud-based C programming platform.
2. Create a new C program.
3. Write a program to display student details such as name, registration number, department, and year of study.
4. Save the program as student.c.
5. Compile the program using the cloud platform's C compiler.
6. Execute the program.
7. Verify that the student details are displayed correctly.
8. Modify the student information and execute the program again.
9. Confirm that the program runs successfully in the cloud environment.

Implementation

Input:

main.c

```c
#include <stdio.h>

int main() {
    char name[] = "Dharani";
    char reg_no[] = "192525280";
    char department[] = "AIML";
    int year = 2;

    printf("Student Information\n");
    printf("-------------------\n");
    printf("Name: %s\n", name);
    printf("Registration Number: %s\n", reg_no);
    printf("Department: %s\n", department);
    printf("Year of Study: %d\n", year);

    return 0;
}
```

Output:

input

```
Student Information
-------------------
Name: Dharani
Registration Number: 192525280
Department: AIML
Year of Study: 2

...Program finished with exit code 0
Press ENTER to exit console.
```

Result

Thus, the **C program** to display student information was successfully developed and executed in a **cloud-based programming environment**, demonstrating the use of cloud resources for program execution.
