Experiment - 16

Change Hardware Compatibility of a Virtual Machine and Run Unix Commands

Aim

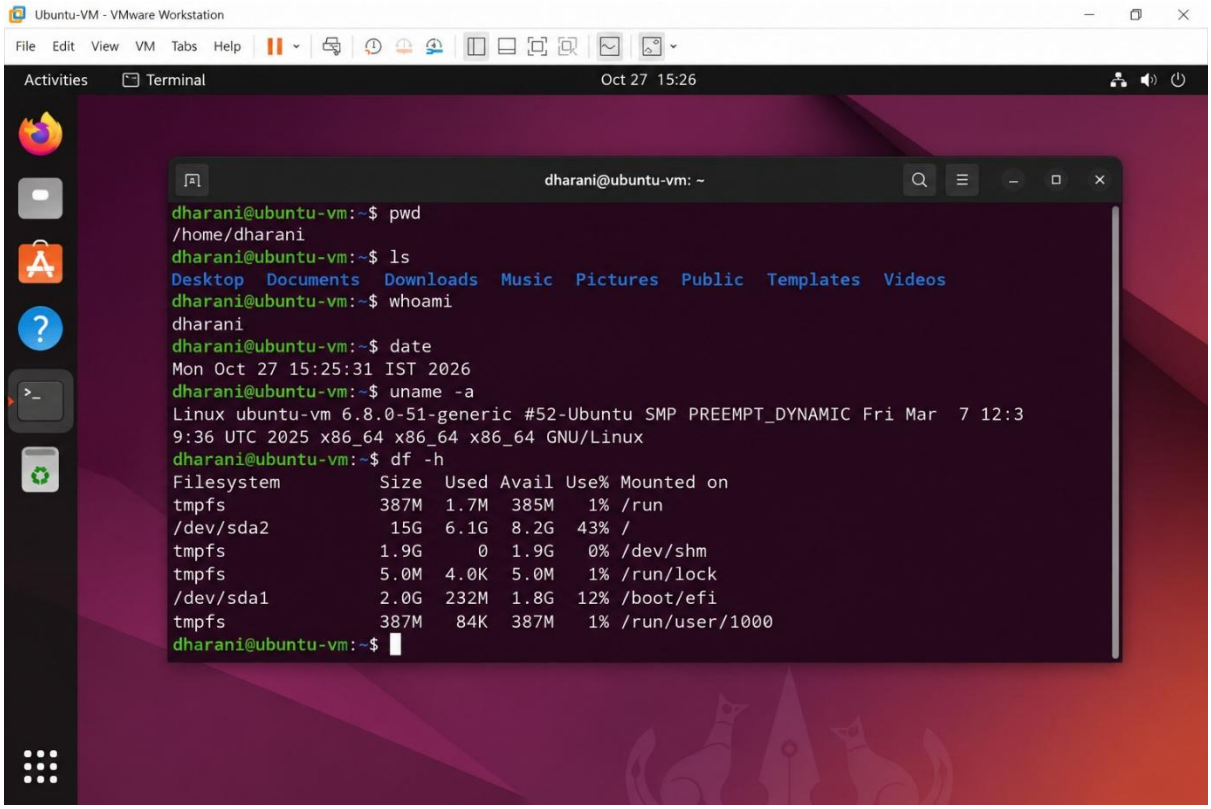

To change the hardware compatibility of an existing virtual machine by cloning or creating a compatible VM, and execute basic Unix commands to verify its operation.

Procedure

1. Start the computer and open VMware Workstation.
2. Select an existing virtual machine.
3. Check the current hardware compatibility version in the VM settings or summary.
4. Shut down the virtual machine completely.
5. Create a clone of the virtual machine or use the option to change its hardware compatibility, if available.
6. Select the required hardware compatibility version supported by your VMware Workstation installation.
7. Confirm the changes and complete the configuration.
8. Start the virtual machine and verify that the guest operating system boots successfully.
9. Open the terminal inside the Linux guest operating system.
10. Execute the following Unix commands one by one.
    - pwd — displays the current working directory.
    - ls — lists files and directories.
    - whoami — displays the current username.
    - date — displays the system date and time.
    - uname -a — displays system and kernel information.
    - df -h — displays disk space usage.
11. Observe and record the output of each command.
12. Verify that the virtual machine operates correctly after the compatibility change.

Implementation

Output:

Result

Thus, the hardware compatibility of a virtual machine was changed using VMware Workstation, and basic Unix commands were executed successfully to verify the operation of the guest operating system.
