Experiment - 13

Create a Virtual Machine Using a Type-2 Virtualization Software

Aim

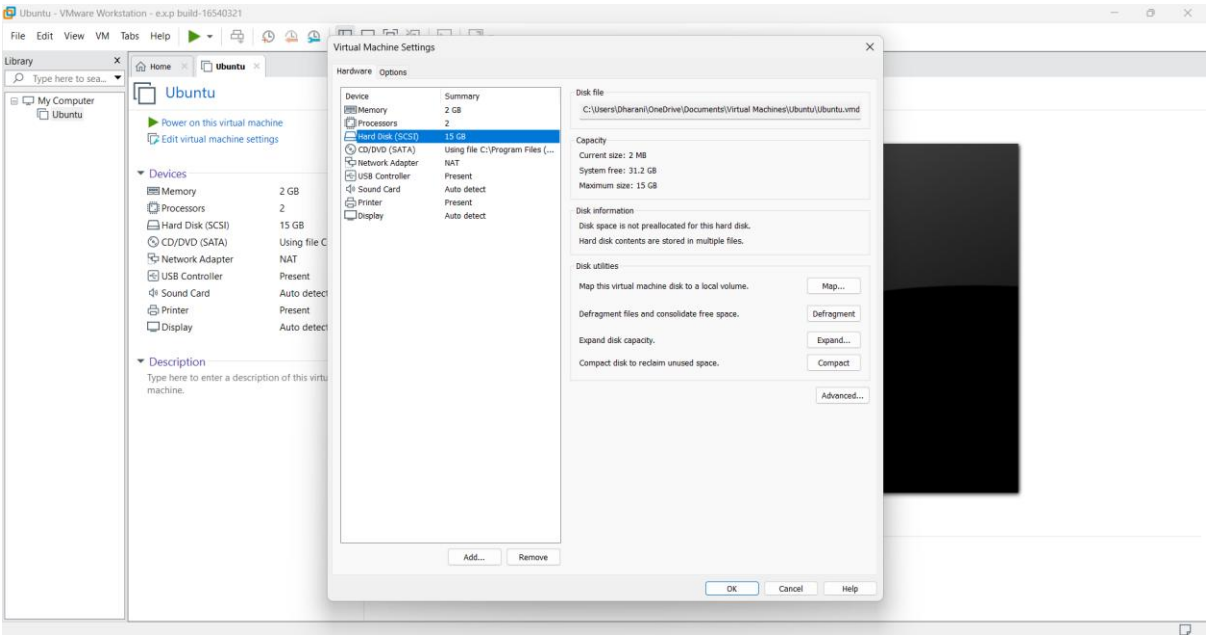

To create a virtual machine with 1 CPU, 2 GB RAM, and 15 GB storage using Type-2 virtualization software such as **Oracle VirtualBox or VMware Workstation**.

Procedure

1. Start the computer and verify that the host operating system is running.
2. Download and install Oracle VirtualBox from https://www.virtualbox.org/.
3. Download a suitable guest operating system ISO file, such as Ubuntu Linux.
4. Open Oracle VirtualBox.
5. Click New to create a virtual machine.
6. Enter the virtual machine name as Ubuntu-VM.
7. Select the downloaded Ubuntu ISO file.
8. Configure the virtual machine with the following resources:
    i. CPU: 1 processor
    ii. RAM: 2048 MB (2 GB)
    iii. Virtual Hard Disk: 15 GB
9. Choose a dynamically allocated virtual disk if that option is available.
10. Review the configuration and click Finish.
11. Select the newly created virtual machine and click Start.
12. Follow the guest operating system installation instructions.
13. Restart the virtual machine after installation, if required.
14. Verify that the guest operating system starts successfully with the allocated resources.
15. Observe the virtual machine settings to confirm the CPU, memory, and storage configuration.

Implementation

Output:

Result

Thus, a virtual machine was successfully created using Type-2 virtualization software with 1 CPU, 2 GB RAM, and 15 GB storage, demonstrating the allocation of virtual computing resources.
